

CASE STUDY:**Japanese bank upgrading its 11i solution to R12****Scenario**

This client was acutely aware of the complexities of setting up VAT for the Belgium VAT jurisdiction and worried that they would not have

enough time during the cutover weekend to get the required tax setups as well as everything else that needed to be done.

Approach

eBiz Answers worked closely with the end client to establish the Belgium VAT solution, taking full advantage of the Oracle seeded localisations around Belgium Allocations that are a fiscal requirement in that country. We configured and fully tested the VAT solution and spent time with the end users to train them on the newly automated way in which the tax was determined.

We used the **eBTax Rapid Install** tool to save time, ensure accuracy to copy the solution from instance to instance and then into the production environment during the cutover weekend. The client said that without our eBTax Rapid Install tool they would not have been able to complete the tax setup in the available.
